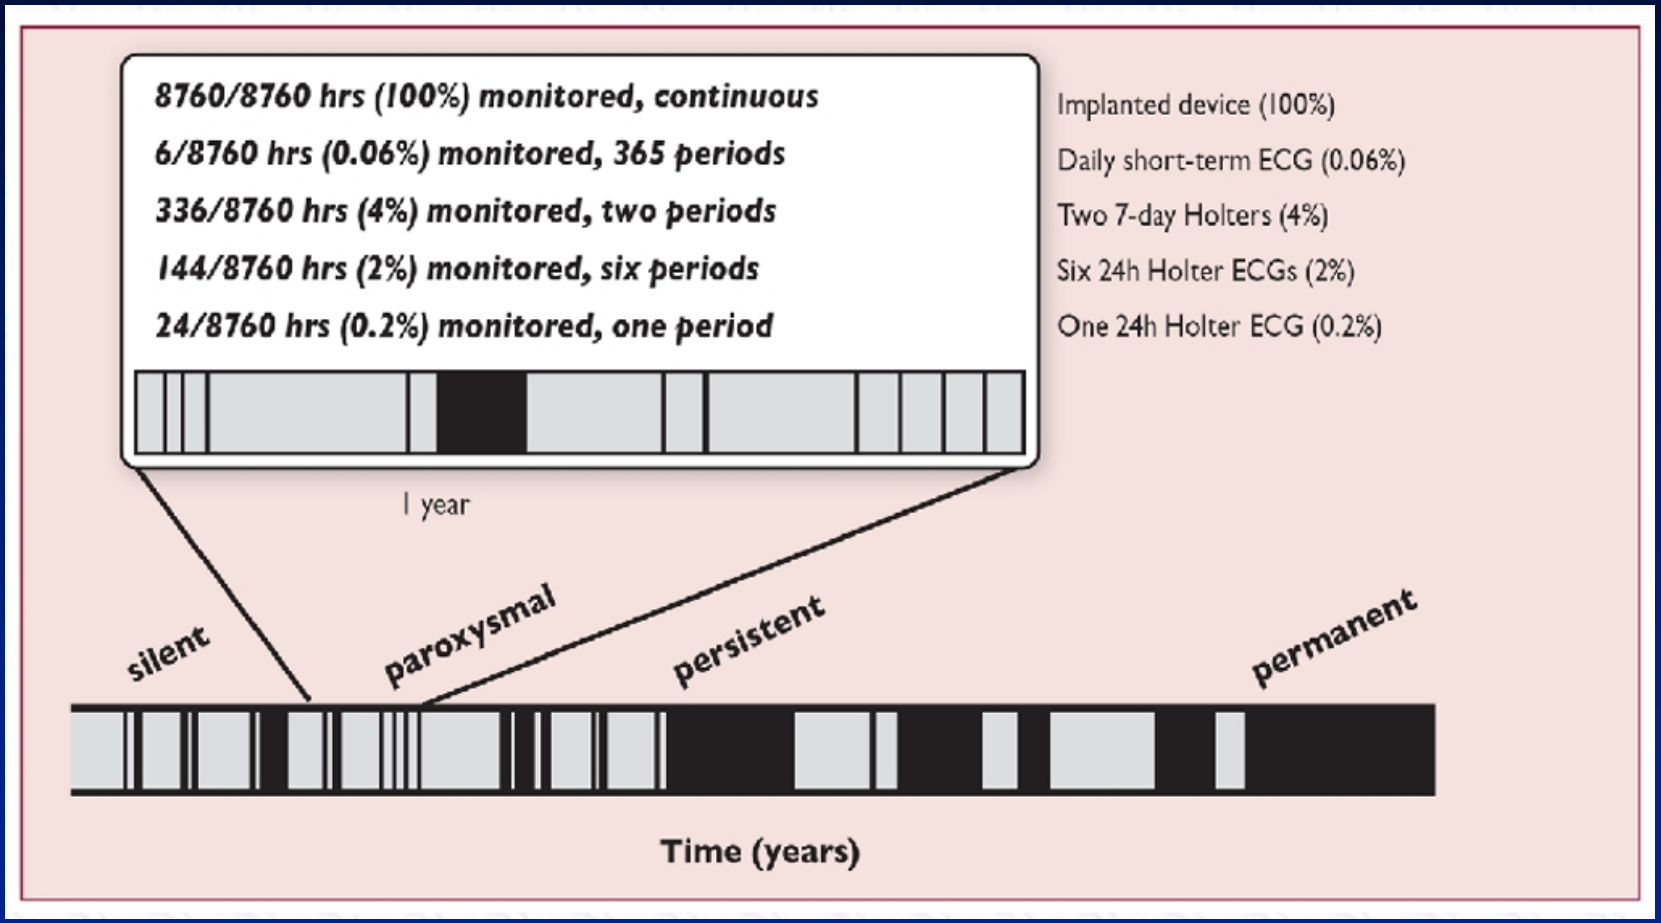
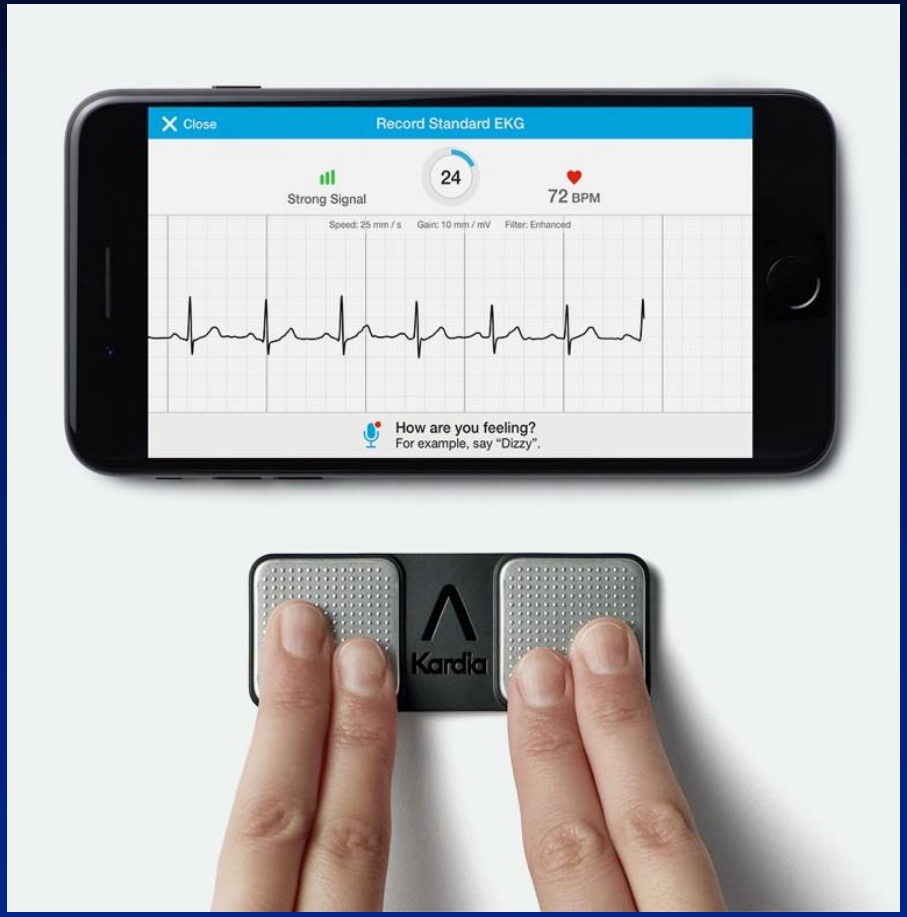
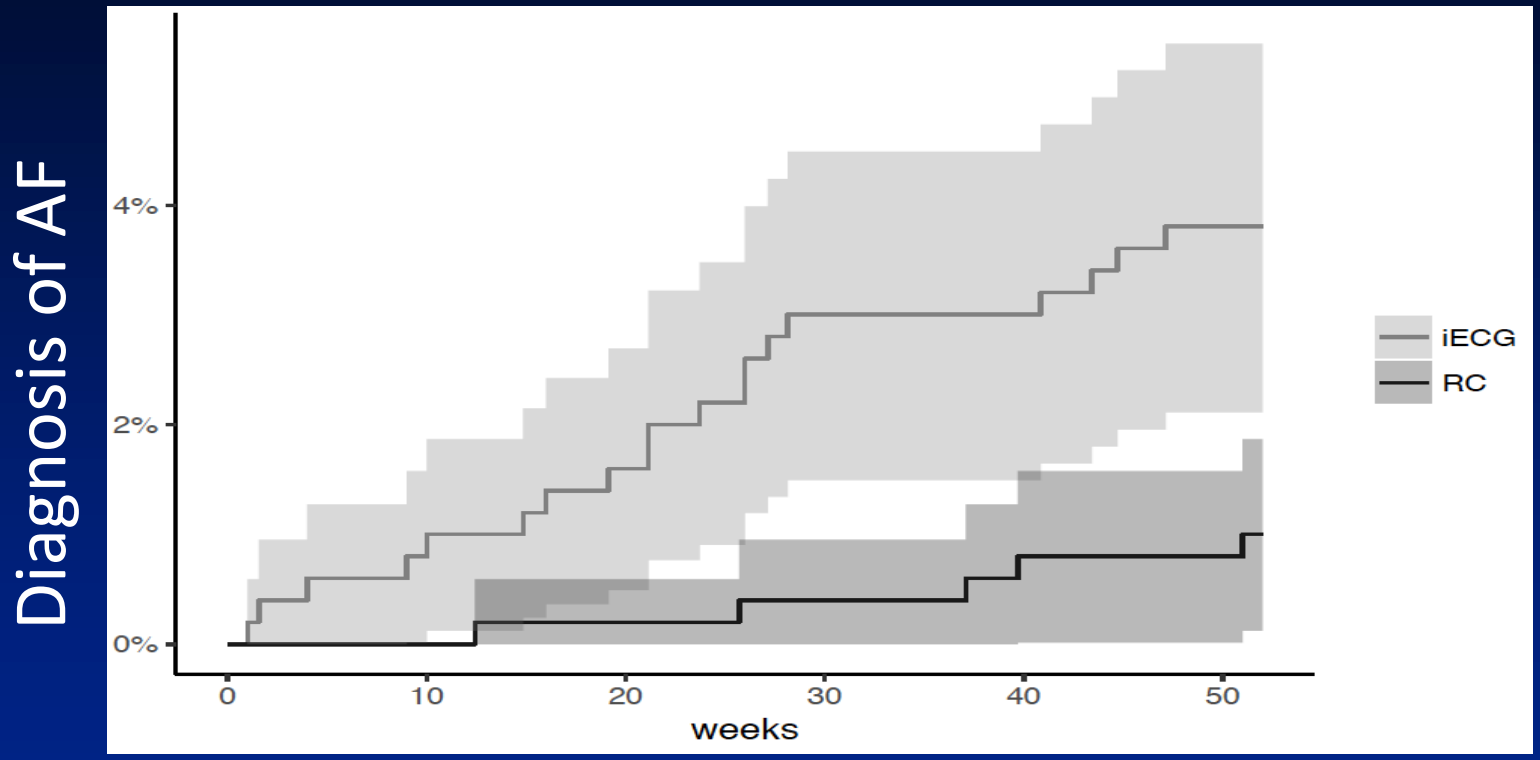
DIAGNOSTIC YIELD OF SCREENING TECHNIQUES



AliveCor Kardia Mobile



Diagnosis of AF

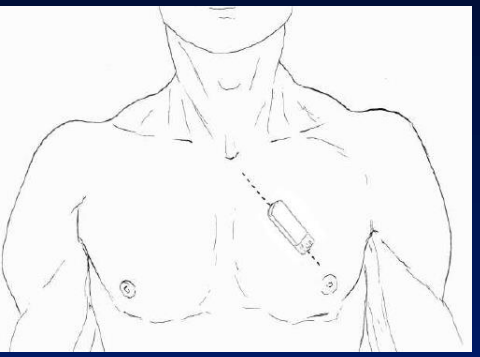


CRYSTAL-AF: Primary Objective

- **Assess whether a long-term cardiac monitoring strategy with an insertable cardiac monitor (ICM) is superior to standard monitoring for the detection of AF in patients with cryptogenic stroke**

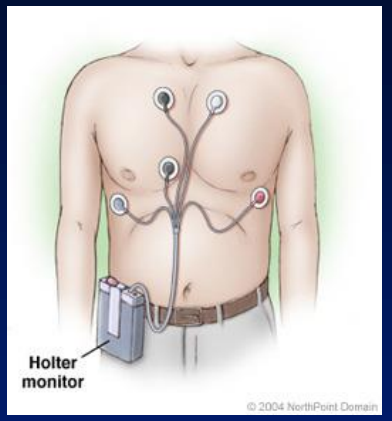
Comparison of Monitoring Strategies

Continuous Monitoring Arm: Insertion of REVEAL® XT

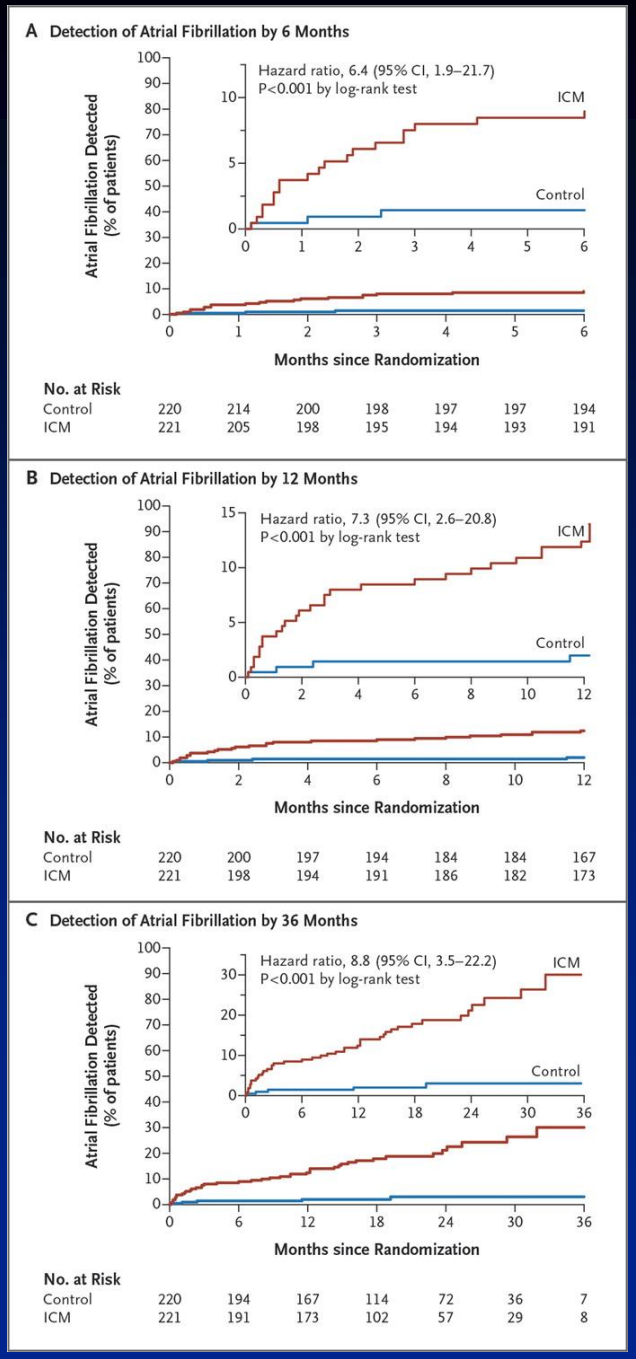


- Minimally invasive outpatient procedure
- Local anesthetic and no leads or fluoroscopy
- 15-30 minute procedure
- Device can be followed remotely
- MRI conditional
- 3 year device longevity
- Automatic AF detection algorithm

Standard Monitoring Arm



- Cardiac monitoring performed according to local standards, after mandated testing completed
- Symptoms consistent with AF were evaluated by study physicians



A Detection of Atrial Fibrillation by 6 Months
Hazard ratio, 6.4 (95% CI, 1.9–21.7)
P<0.001 by log-rank test
ICM
Control
Atrial Fibrillation Detected (% of patients)
Months since Randomization
No. at Risk
Control 220 214 200 198 197 197 194
ICM 221 205 198 195 194 193 191
B Detection of Atrial Fibrillation by 12 Months
Hazard ratio, 7.3 (95% CI, 2.6–20.8)
P<0.001 by log-rank test
ICM
Control
Atrial Fibrillation Detected (% of patients)
Months since Randomization
No. at Risk
Control 220 200 197 194 184 184 167
ICM 221 198 194 191 186 182 173
C Detection of Atrial Fibrillation by 36 Months
Hazard ratio, 8.8 (95% CI, 3.5–22.2)
P<0.001 by log-rank test
ICM
Control
Atrial Fibrillation Detected (% of patients)
Months since Randomization
No. at Risk
Control 220 194 167 114 72 36 7
ICM 221 191 173 102 57 29 8

Conclusions

- A-Fib detection of 30% in the ICM versus 3% in the control arm at 36 months
- Duration was more than 6 minutes on one or more days in > 94% of patients
- 89% of patients were prescribed OAC
- Majority of first AF episodes (75%) were asymptomatic
- 250 tests were required in order to find 5 patients with AF in the control arm
- Long-term continuous monitoring should be performed in patients with cryptogenic stroke

CARDIOVASCULAR MORBIDITY AND MORTALITY WITH A-FIB

Event	Association with AF
Death	Increased mortality, especially cardiovascular mortality due to sudden death, heart failure or stroke.
Stroke	20–30% of all strokes are due to AF. A growing number of patients with stroke are diagnosed with 'silent', paroxysmal AF.
Hospitalizations	10–40% of AF patients are hospitalized every year.
Quality of life	Quality of life is impaired in AF patients independent of other cardiovascular conditions.
Left ventricular dysfunction and heart failure	Left ventricular dysfunction is found in 20–30% of all AF patients. AF causes or aggravates LV dysfunction in many AF patients, while others have completely preserved LV function despite long-standing AF.
Cognitive decline and vascular dementia	Cognitive decline and vascular dementia can develop even in anticoagulated AF patients. Brain white matter lesions are more common in AF patients than in patients without AF.

Category	Intervention	Follow-up aspects	Performance indicator (examples)
Prognostic	Comorbidity control (relevant examples given)	Obesity Arterial hypertension Heart failure Coronary artery disease Diabetes Valvular heart disease	Weight loss Blood pressure control Heart failure therapy and hospitalizations Statin and antiplatelet therapy; revascularization Glycaemic control Valve repair or replacement
Prognostic	Anticoagulation	Indication (risk profile; timing, e.g. post-cardioversion). Adherence (NOAC or VKA) and INR (if VKA). NOAC dosing (co-medications; age; weight; renal function).	Stroke Bleeding Mortality
Mainly symptomatic Partly prognostic	Rate control	Symptoms Average resting heart rate <110 bpm	Modified EHRA score Heart failure status LV function Exercise capacity Hospitalization Therapy complications
Symptomatic at present	Rhythm control	Symptoms vs. side effects Exclusion of pro-arrhythmia (PR; QRS; QTc interval)	
Relevant for implementation of therapy and adherence	Patient education and self-care capabilities	Knowledge (about disease; about treatment; about management goals) Capabilities (what to do if...)	Adherence to therapy Directed evaluation, preferably based on systematic checklists
Relevant for chronic care management	Caregiver involvement	Who? (spouse; GP; home nurse; pharmacist) Clearly spelling out participation roles Knowledge and capabilities	Directed evaluation of task performance (e.g. via patient card) Dispensed medication Log of follow-up visits

HAS-BLED Score

Letter	Clinical Characteristic	Points Awarded
H	Hypertension	1
A	Abnormal renal &/or liver function (1 point each)	1 or 2
S	Stroke history	1
B	Bleeding	1
L	Labile INRs	1
E	Elderly (age ≥ 65)	1
D	Drugs or alcohol (1 point each)	1 or 2
	Maximum score	**9**

Hypertension = systolic BP≥160 mmHg; Abnormal renal function = presence of chronic dialysis or renal transplantation or serum creatinine≥200μmol/L; Abnormal liver function = chronic hepatitis disease (e.g., cirrhosis) or biochemical evidence of significant hepatic derangement (e.g., bilirubin>2x upper limit of normal, in association with AST/ALP/ALP>3x upper limit normal, etc.); Bleeding = previous bleeding history or predisposition to bleeding (e.g., bleeding diathesis, anemia, etc.); Labile INRs = unstable/high INRs or poor time in therapeutic range (e.g., <60%); Drugs or alcohol = concomitant use of drugs, such as antiplatelet agents, non-steroidal anti-inflammatories, or alcohol abuse, etc.; INR = international normalized ratio

Annual Adjusted Bleeding Rate

0 points = 1.13%
1 point = 1.02%
2 points = 1.88%
3 points = 3.74%
4 points = 8.70%
5 points = 12.50%
Any score = 1.56%

ATRIA Score

	Clinical Characteristic	Points Awarded
	Anemia	3
	Severe renal disease	3
	Age ≥ 75	2
	Bleeding history	1
	Hypertension	1
	Maximum score	**10**

Severe renal disease = glomerular filtration rate <30ml/min or dialysis-dependent
ATRIA = Anticoagulation and Risk Factors in Atrial Fibrillation
0 – 3 points = low risk
4 points = intermediate risk
5 – 10 points = high risk
Annual Adjusted Bleeding Rate
0 – 3 points = 0.8%
4 points = 2.6%
≥ 5 points = 5.8%

HEMORR2HAGES Score

	Clinical Characteristic	Points Awarded
H	Hepatic or renal disease	1
E	Ethanol abuse	1
M	Malignancy	1
O	Older (age >75)	1
R	Reduced platelet count or fxn	1
R_2	Rebleeding risk	2
H	Hypertension (uncontrolled)	1
A	Anemia	1
G	Genetic factors	1
E	Excessive fall risk*	1
S	Stroke	1
	Maximum score	**12**

*Including neuropsychiatric disease
0 – 1 points = low risk
2 – 3 points = intermediate risk
≥4 points = high risk

Annual Adjusted Bleeding Rate
0 points = 1.9%
1 point = 2.5%
2 points = 5.3%
3 points = 8.4%
4 points = 10.4%
≥ 5 points = 12.3%

Outpatient Bleeding Risk Index (OBRI)

	Clinical Characteristic	Points Awarded
	Age ≥ 65 years	1
	History of GI bleeding	1
	History of stroke	1
	One or more comorbid conditions	1
	Maximum score	**4**

Comorbid conditions = recent MI, anemia (hematocrit <30%), renal impairment (creatinine level >1.5mg/dL), or diabetes mellitus
0 points = low risk
1 – 2 points = intermediate risk
≥3 points = high risk

Modifiable bleeding risk factors:
Hypertension (especially when systolic blood pressure is >160 mmHg)
Labile INR or time in therapeutic range <60% in patients on vitamin K antagonists
Medication predisposing to bleeding, such as antiplatelet drugs and non-steroidal anti-inflammatory drugs
Excess alcohol (≥8 drinks/week)
Potentially modifiable bleeding risk factors:
Anaemia
Impaired renal function
Impaired liver function
Reduced platelet count or function

Non-modifiable bleeding risk factors:
Age (>65 years) (≥75 years)
History of major bleeding
Previous stroke
Dialysis-dependent kidney disease or renal transplant
Cirrhotic liver disease
Malignancy
Genetic factors
Biomarker-based bleeding risk factors:
High-sensitivity troponin
Growth differentiation factor-15
Serum creatinine/estimated CrCl

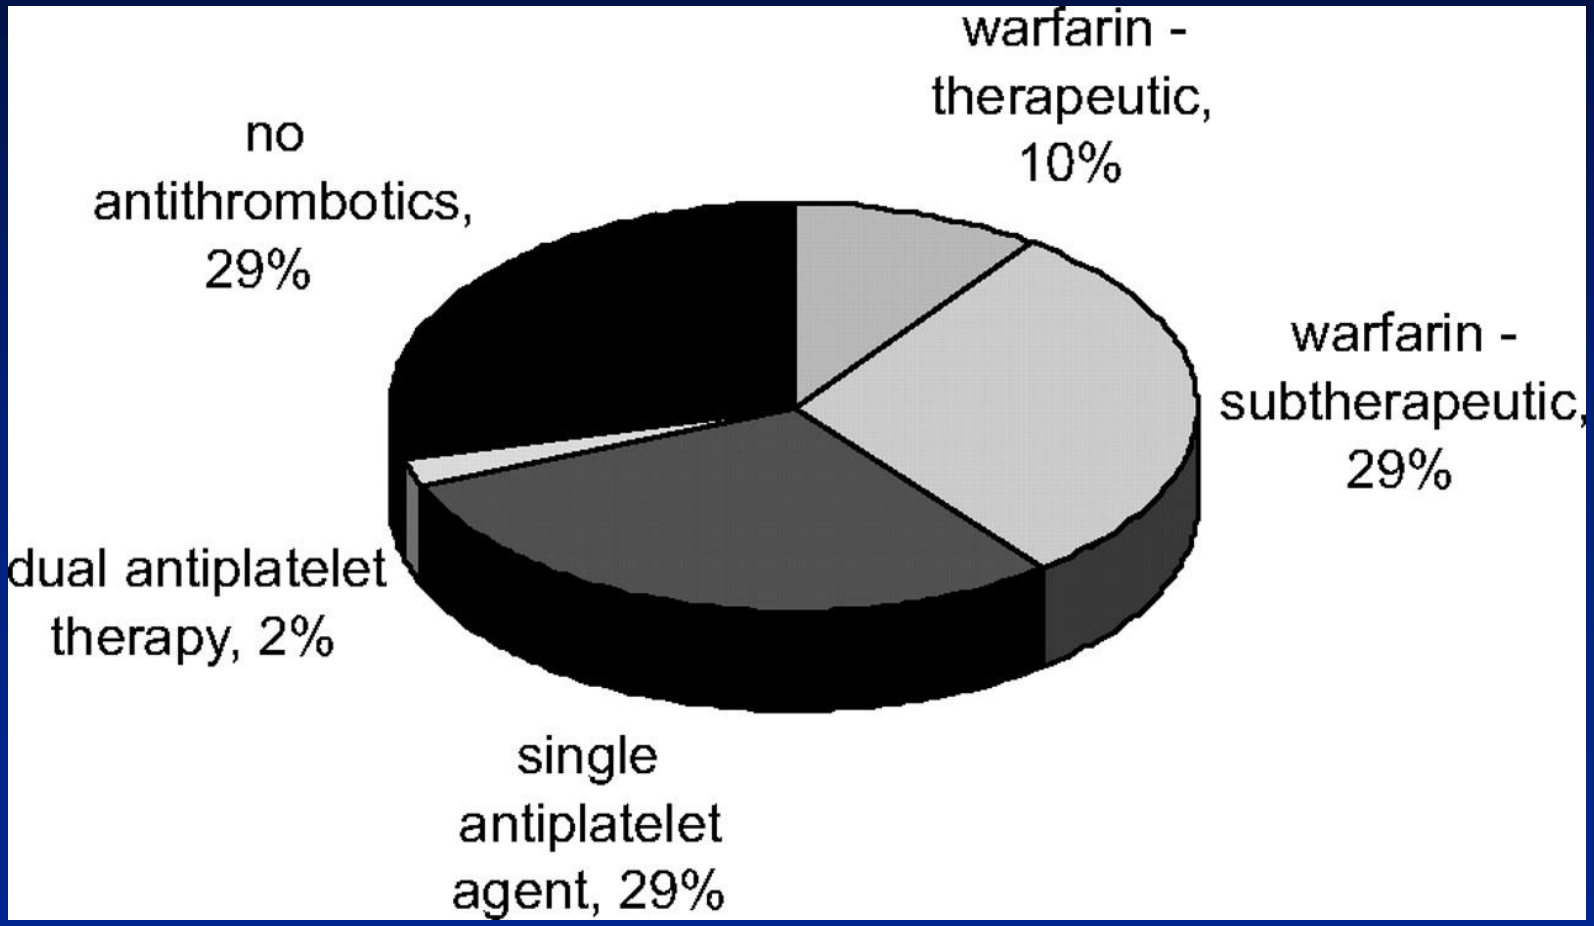
When to close LAA?

Non valvular A-Fib, high risk of stroke

- Contraindication to OAC
- High risk of bleeding with OAC
- Difficult to maintain INR within the therapeutic range
- Poor compliance/intolerance to DOACs
- Recurrence on anticoagulation

Preadmission medications in patients with known A-Fib who were admitted with acute ischemic stroke

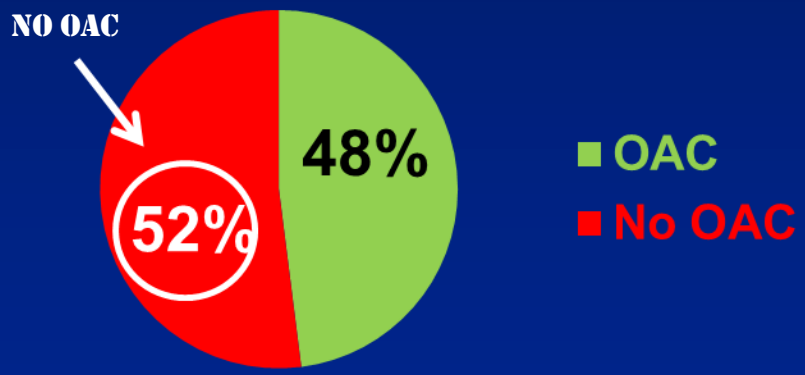
GLADSTONE ET AL STROKE 2009



"Shocking Level" of OAC Undertreatment in A-Fib Patients at High Risk for Stroke

PINNACLE Registry
(N=429,417 outpatients with AF[a])

Most AF Patients at High Risk of Stroke Do Not Receive OAC Therapy!



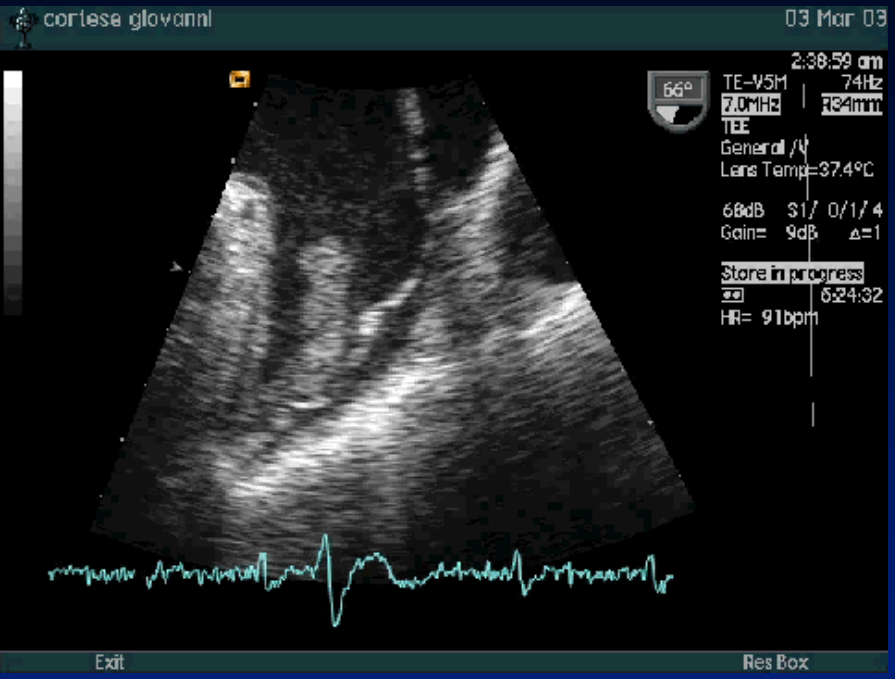
Why???

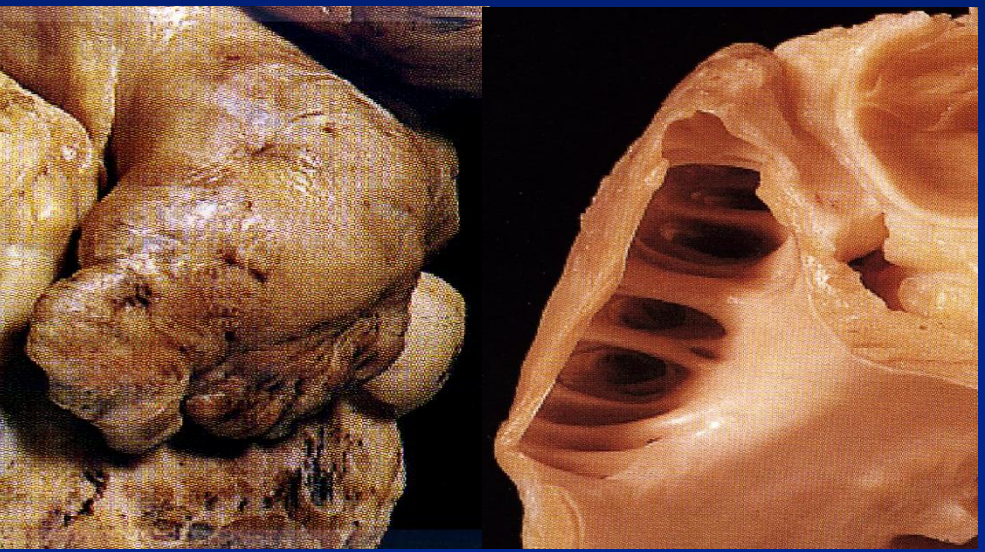
- *"HCPs may be more reluctant to prescribe anticoagulation in sicker patients due to concerns regarding bleeding risk."*
  - >2000 strokes/y could have been prevented if OAC therapy was used

A TREATED BY CARDIOVASCULAR SPECIALISTS

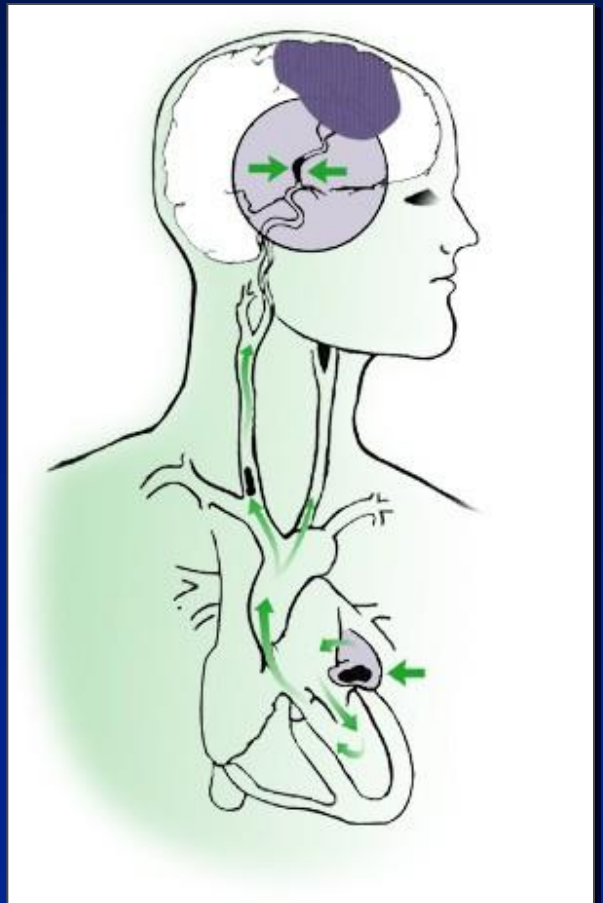
HSU JC ET AL. JAMA CARDIOL. 2016 MAR 16. [EPUB AHEAD OF PRINT]

STROKE IN A-FIB





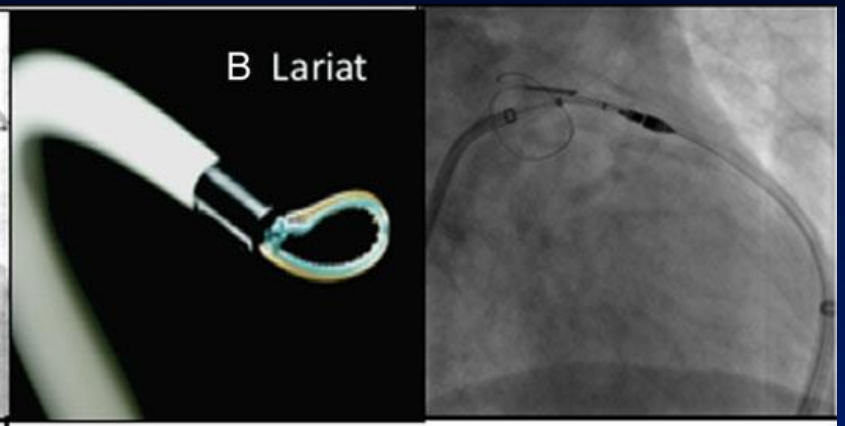
- Stroke in patients with A-Fib is largely due to the LAA as a thromboembolic source



A Watchman

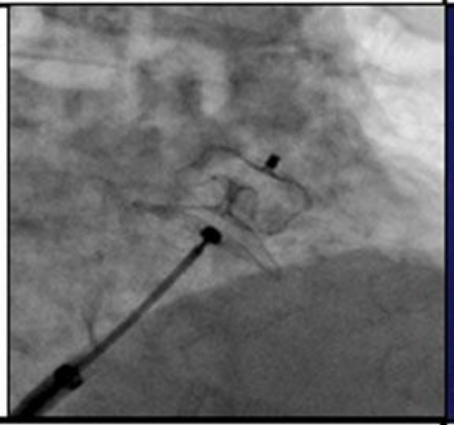
Requirements: LAA length > width, LAA diameter 17-31 mm, able to tolerate OAC x 45 days

B Lariat



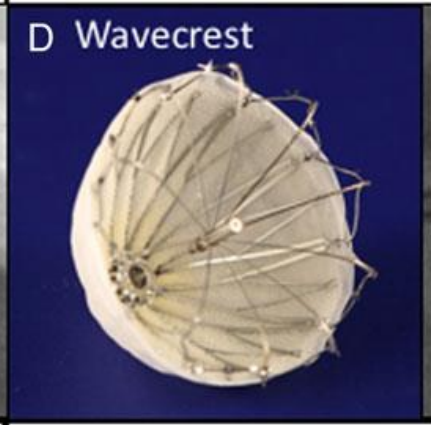
Requirements: No prior cardiac surgery, maximal LAA diameter <40 mm

C Amulet



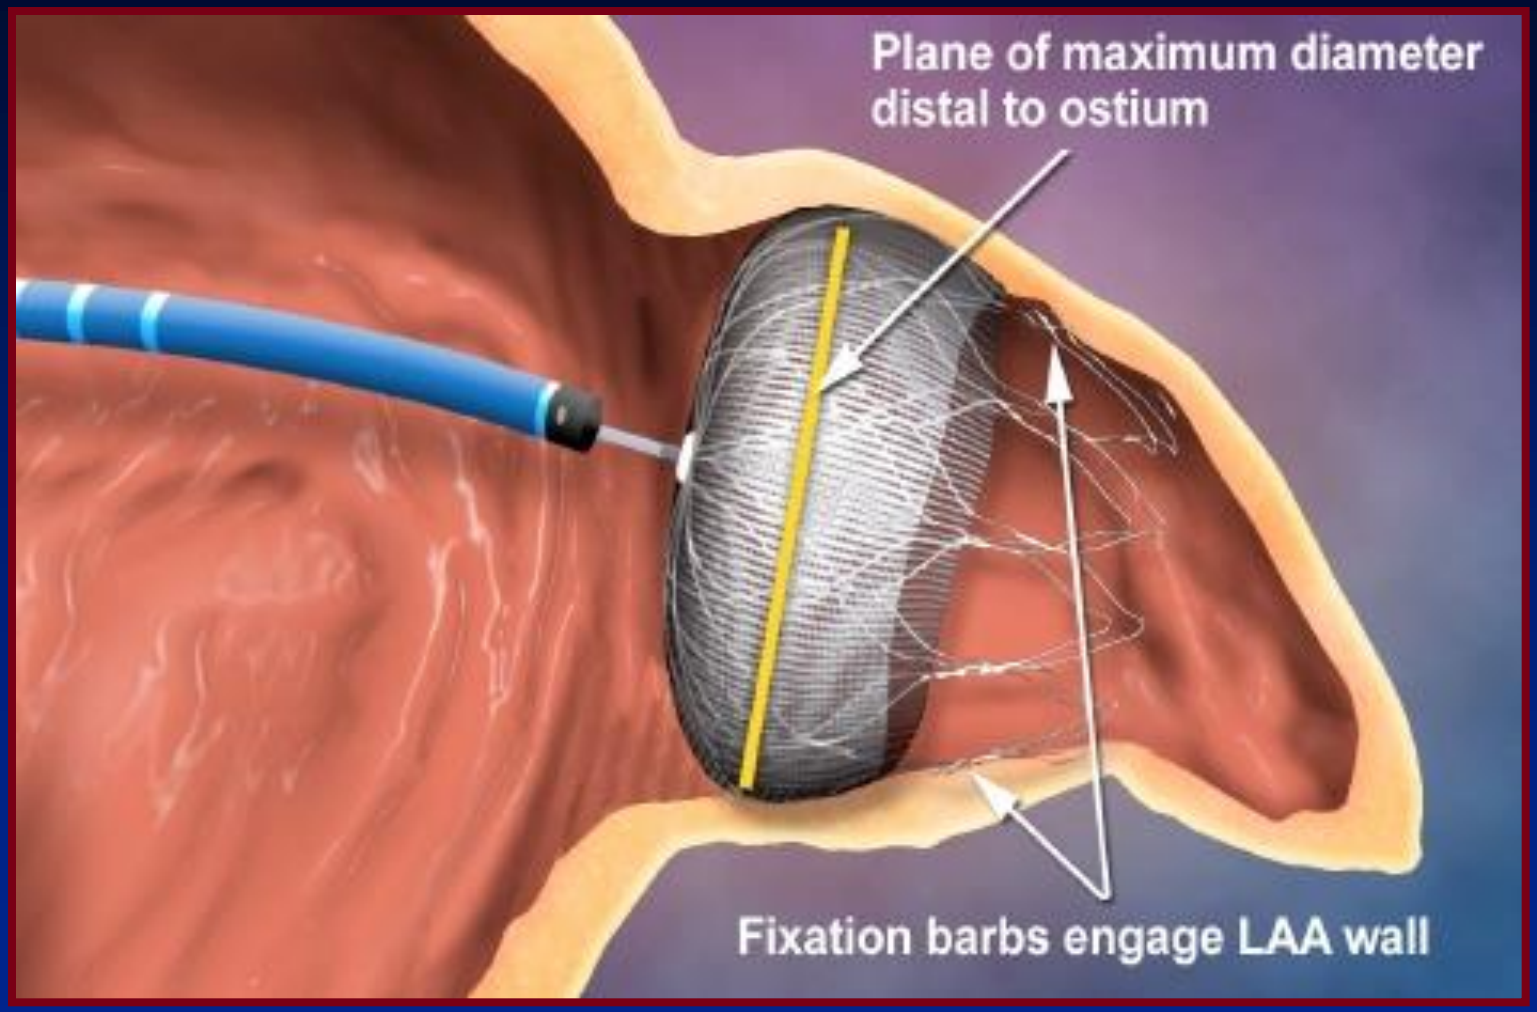
Requirements: Landing zone < 31 mm, LAA length <7.5 mm

D Wavecrest



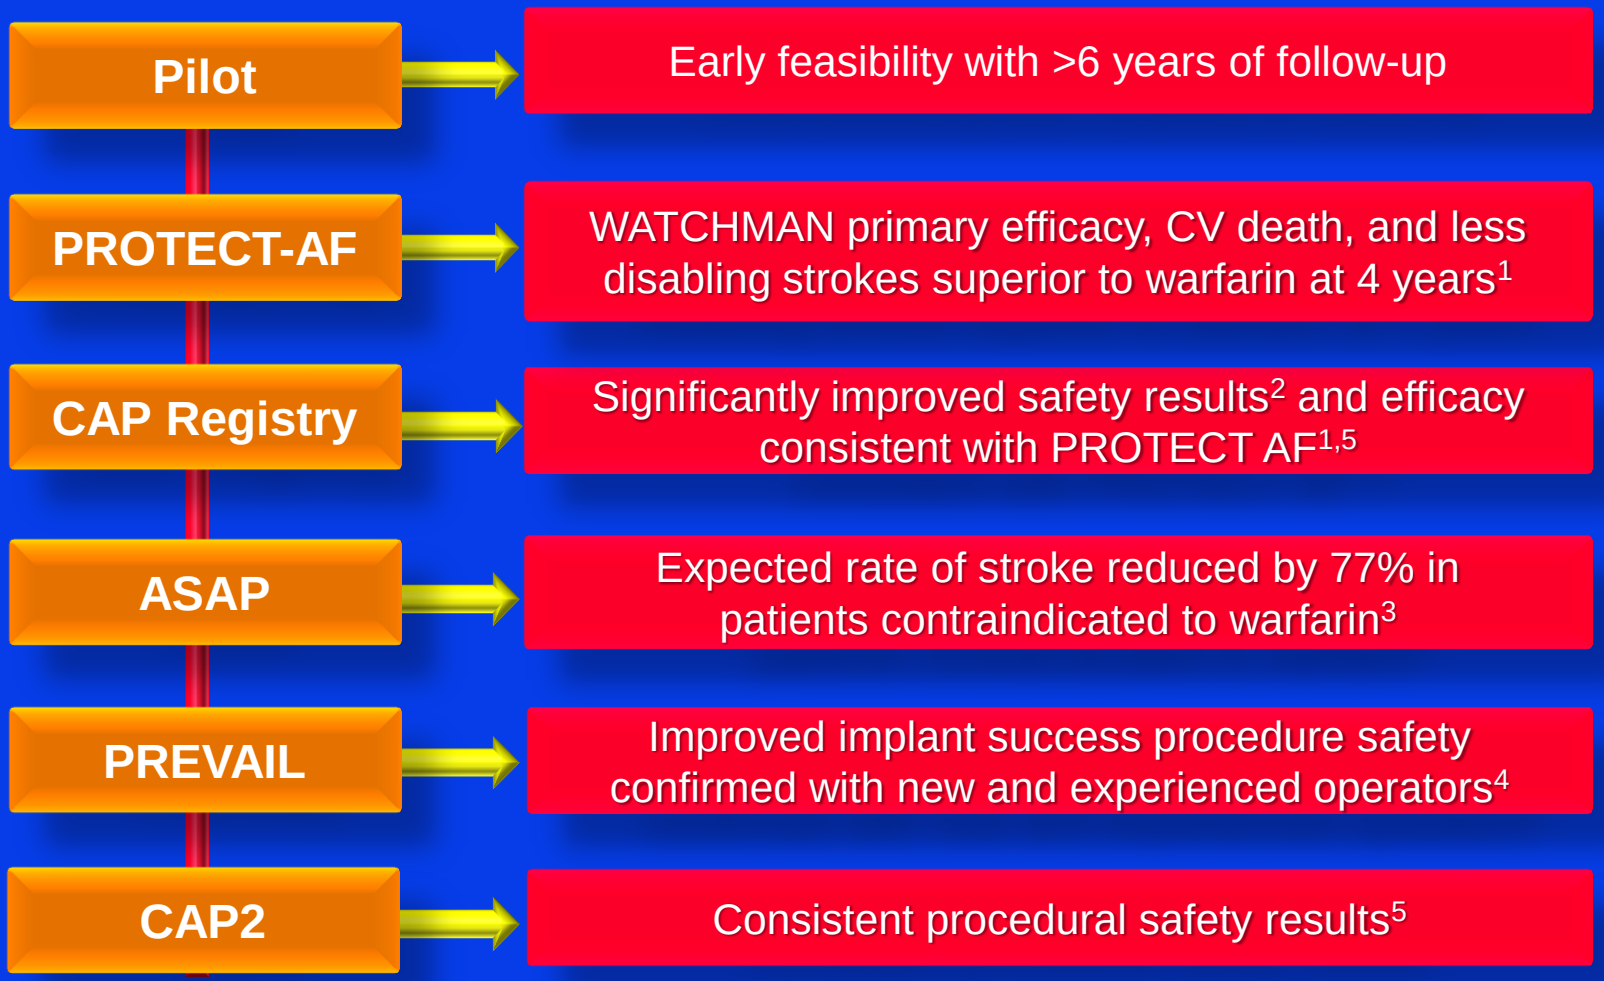
Requirements: Landing zone between 18-30 mm

WATCHMAN LAA Closure Device



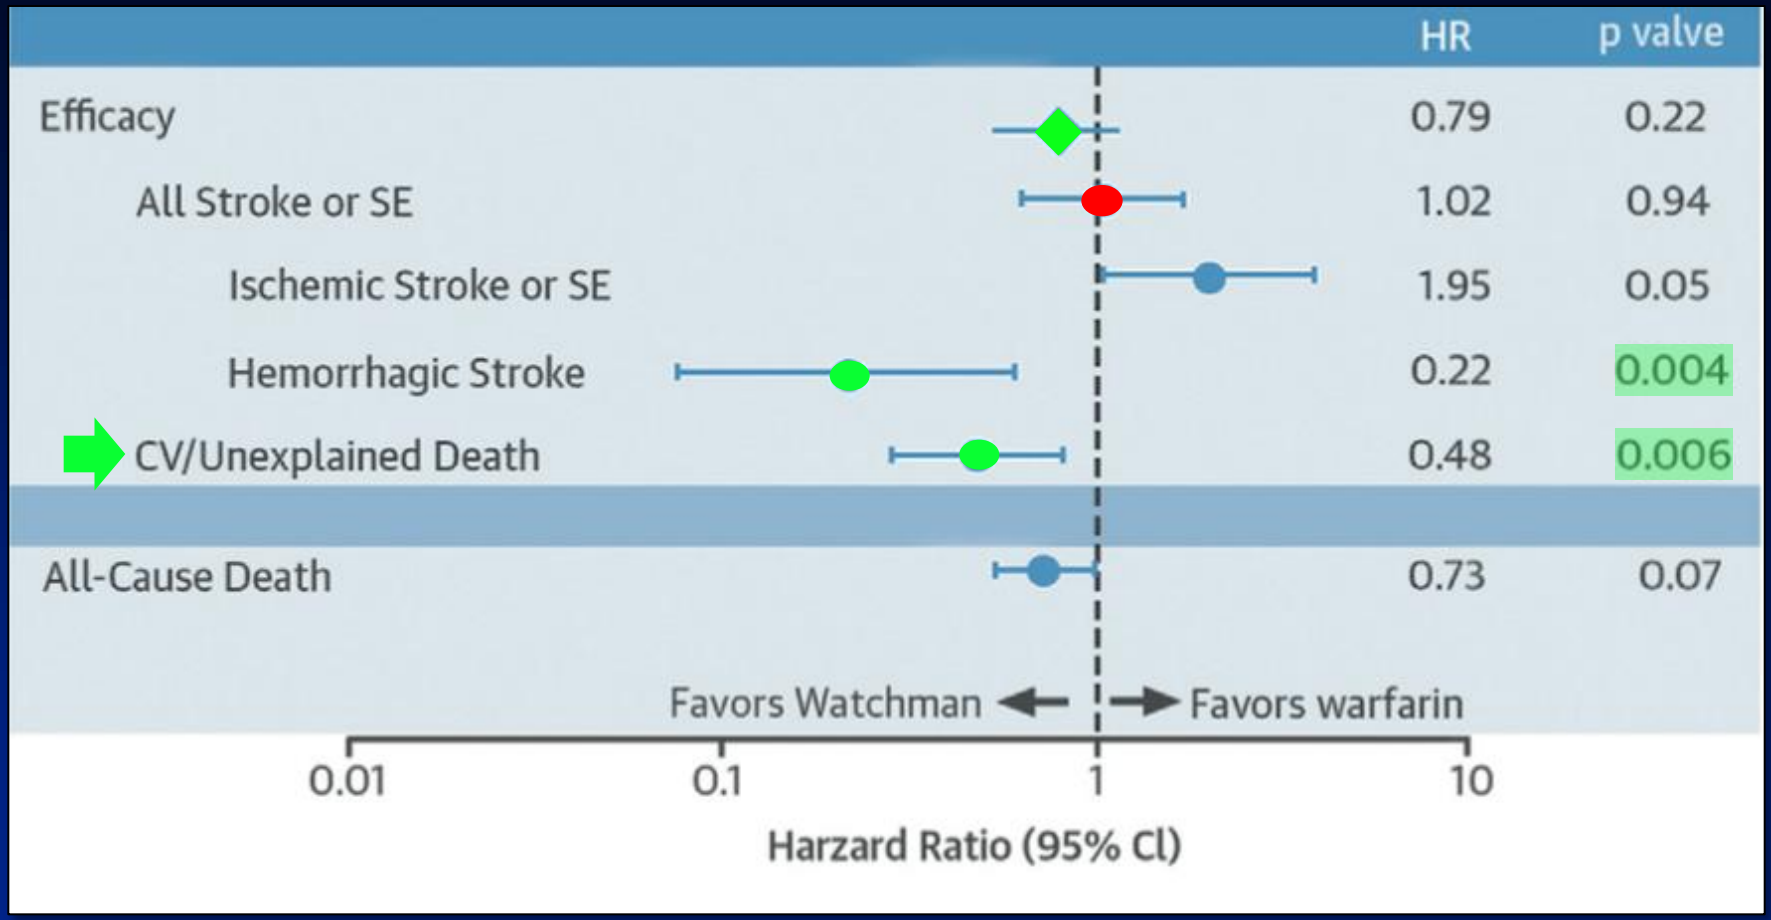
WATCHMAN™ Trials

>2,500 patients with >6,000 patient years follow-up



1 Reddy, VY et al. JAMA. 2014; 312(19):1988-1998. 2 Reddy, VY et al. Circ. 2011;123:417-424; 3 Reddy, et al. JACC 2013; 61(25):2551–6. 4 ***HOLMES, DR ET AL. JACC. 2014; 64(1):1-12. 5 FDA PANEL OCTOBER 2014.***

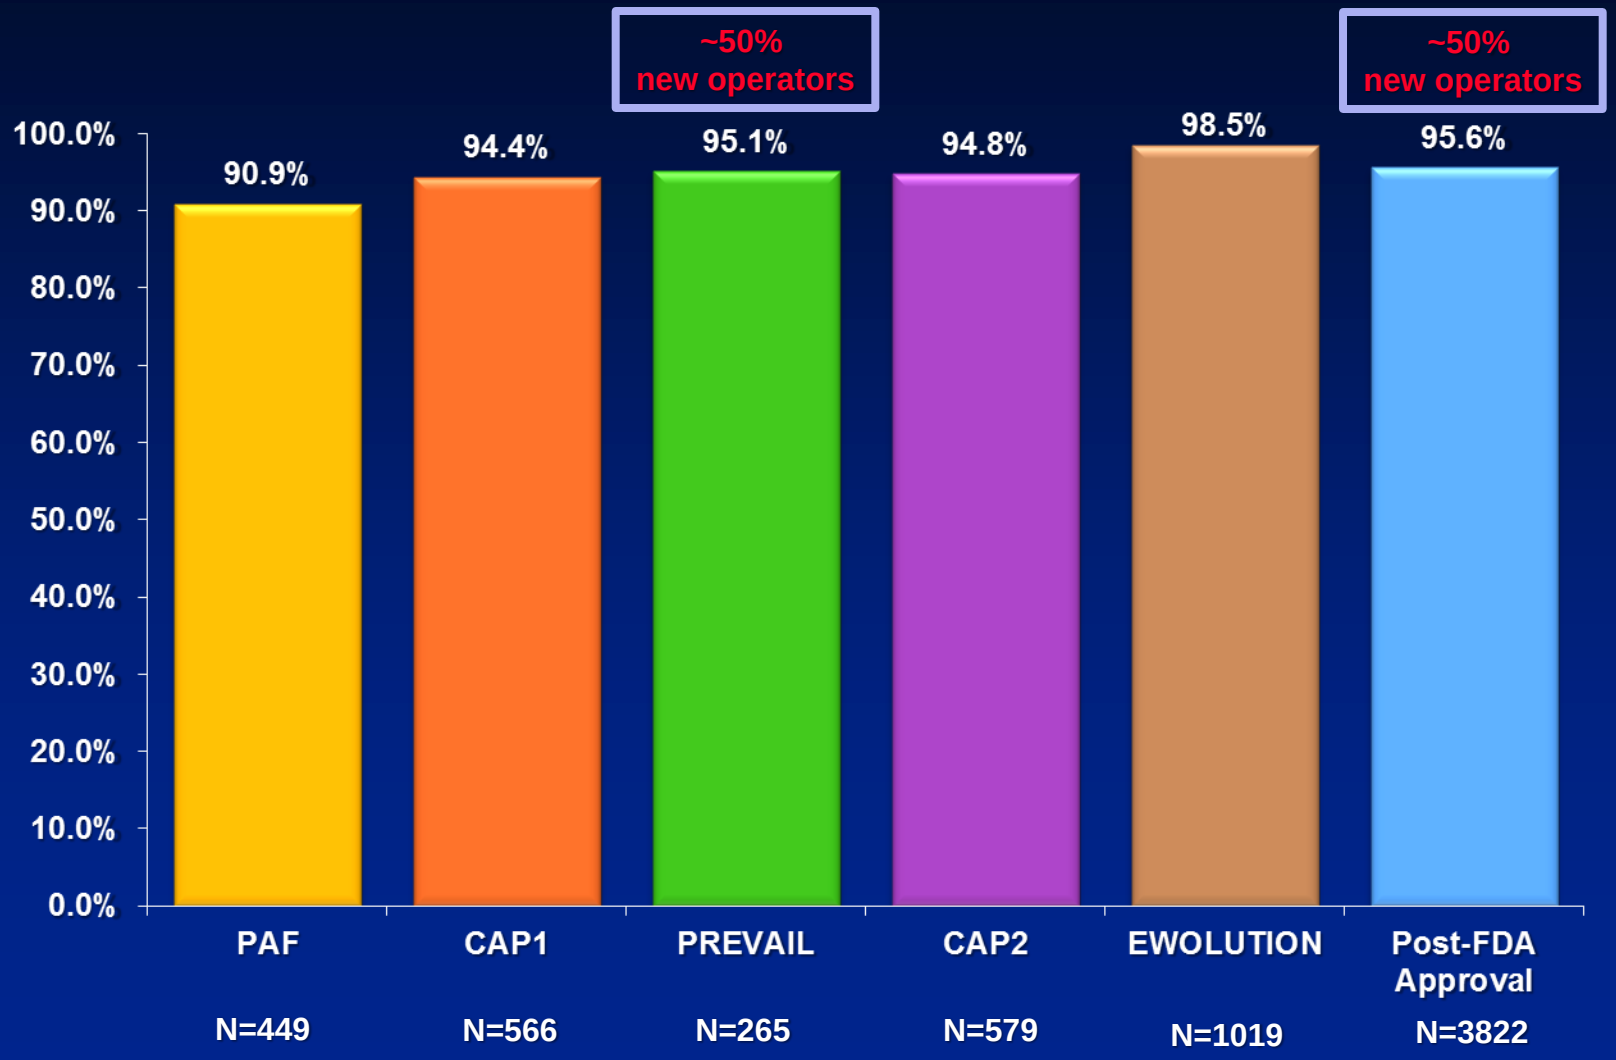
Left Atrial Appendage Closure vs Warfarin in AF
A Patient-Level Meta-Analysis



COMBINATION OF PROTECT AF AND PREVAIL PATIENTS RECEIVING THE WATCHMAN DEVICE, VS WARFARIN FOR OVERALL STROKE, ISCHEMIC STROKE, AND ALL-CAUSE DEATH.

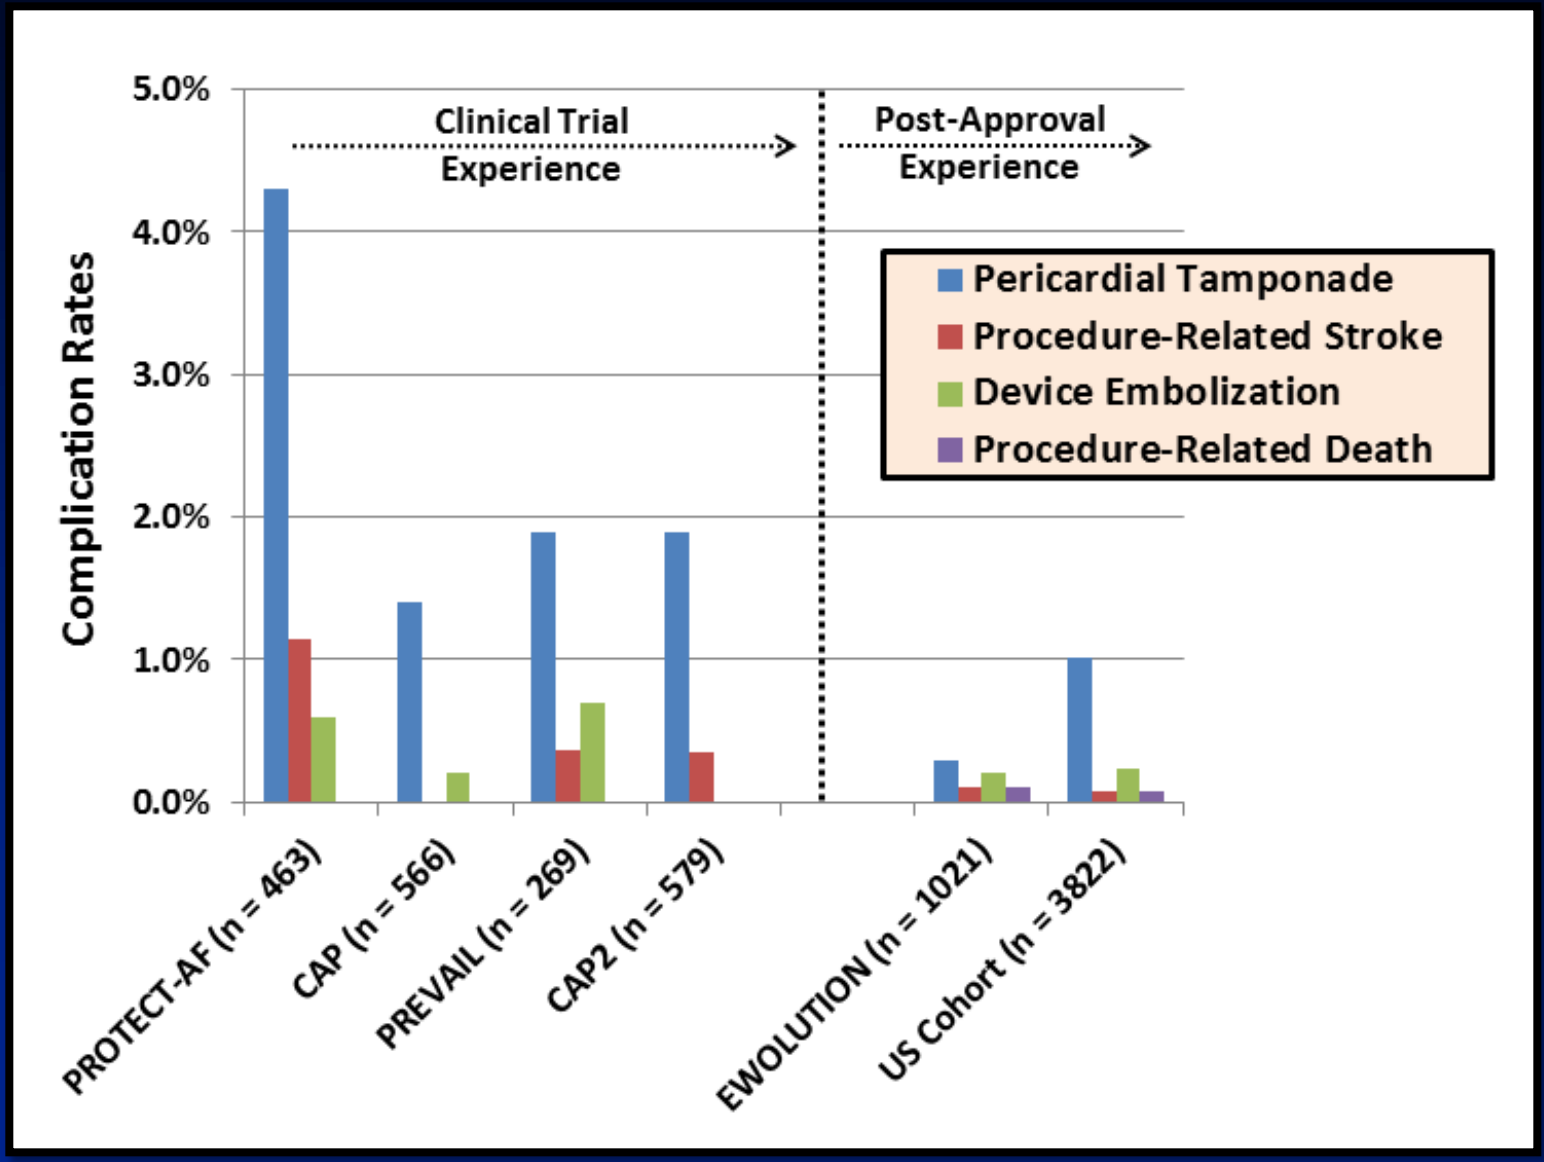
J AM COLL CARDIOL 2015;65:2614–

Procedural Success

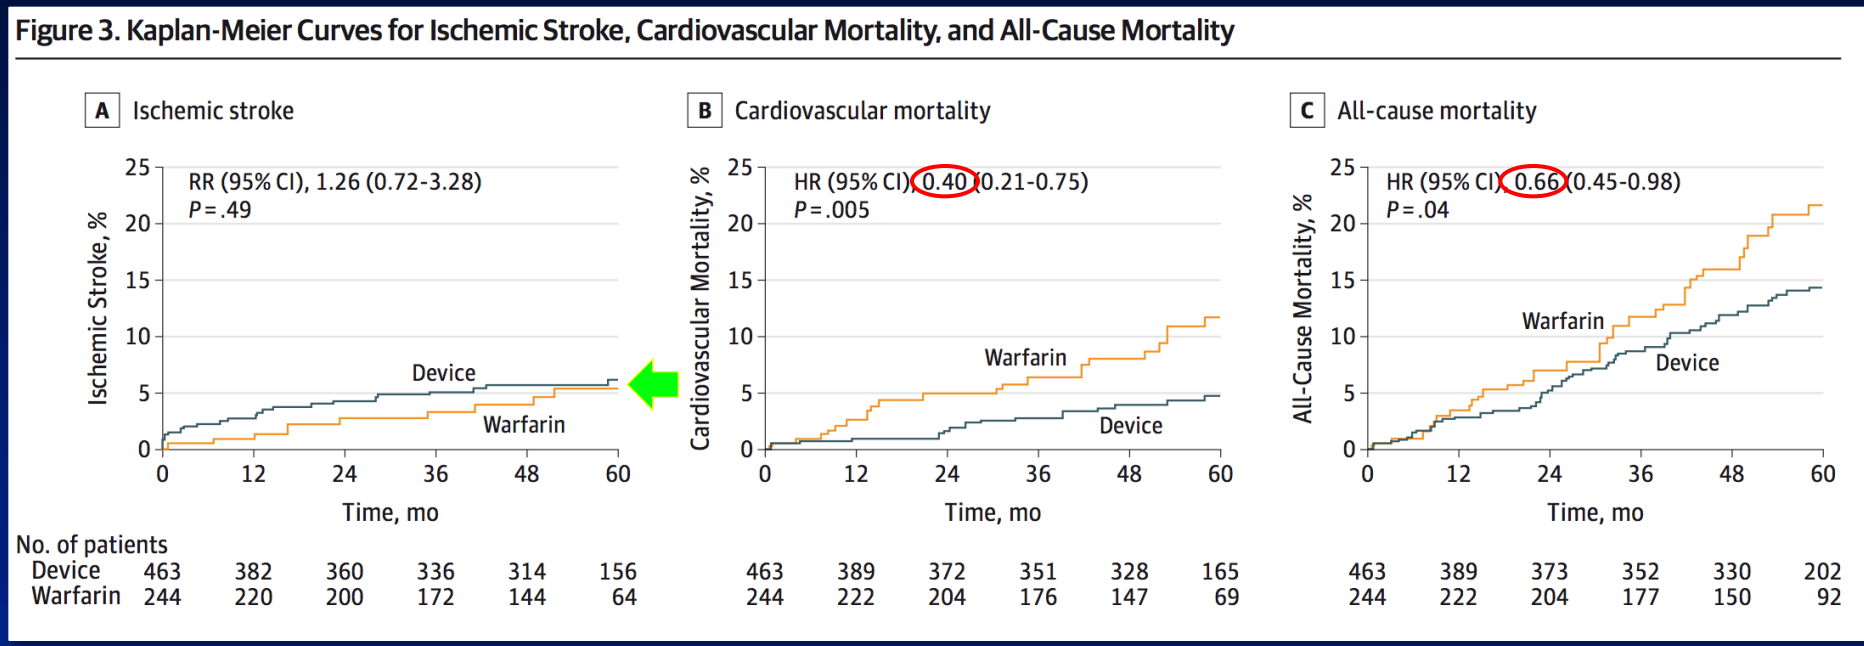


Implant success defined as deployment and release of the device into the LAA; no leak ≥ 5 mm

Comparison of Procedural Complications Across Watchman Studies



WATCHMAN vs Warfarin
4 Year Follow-up



NO DIFFERENCE VS WARFARIN FOR ISCHEMIC STROKE

LOWER MORTALITY VS WARFARIN

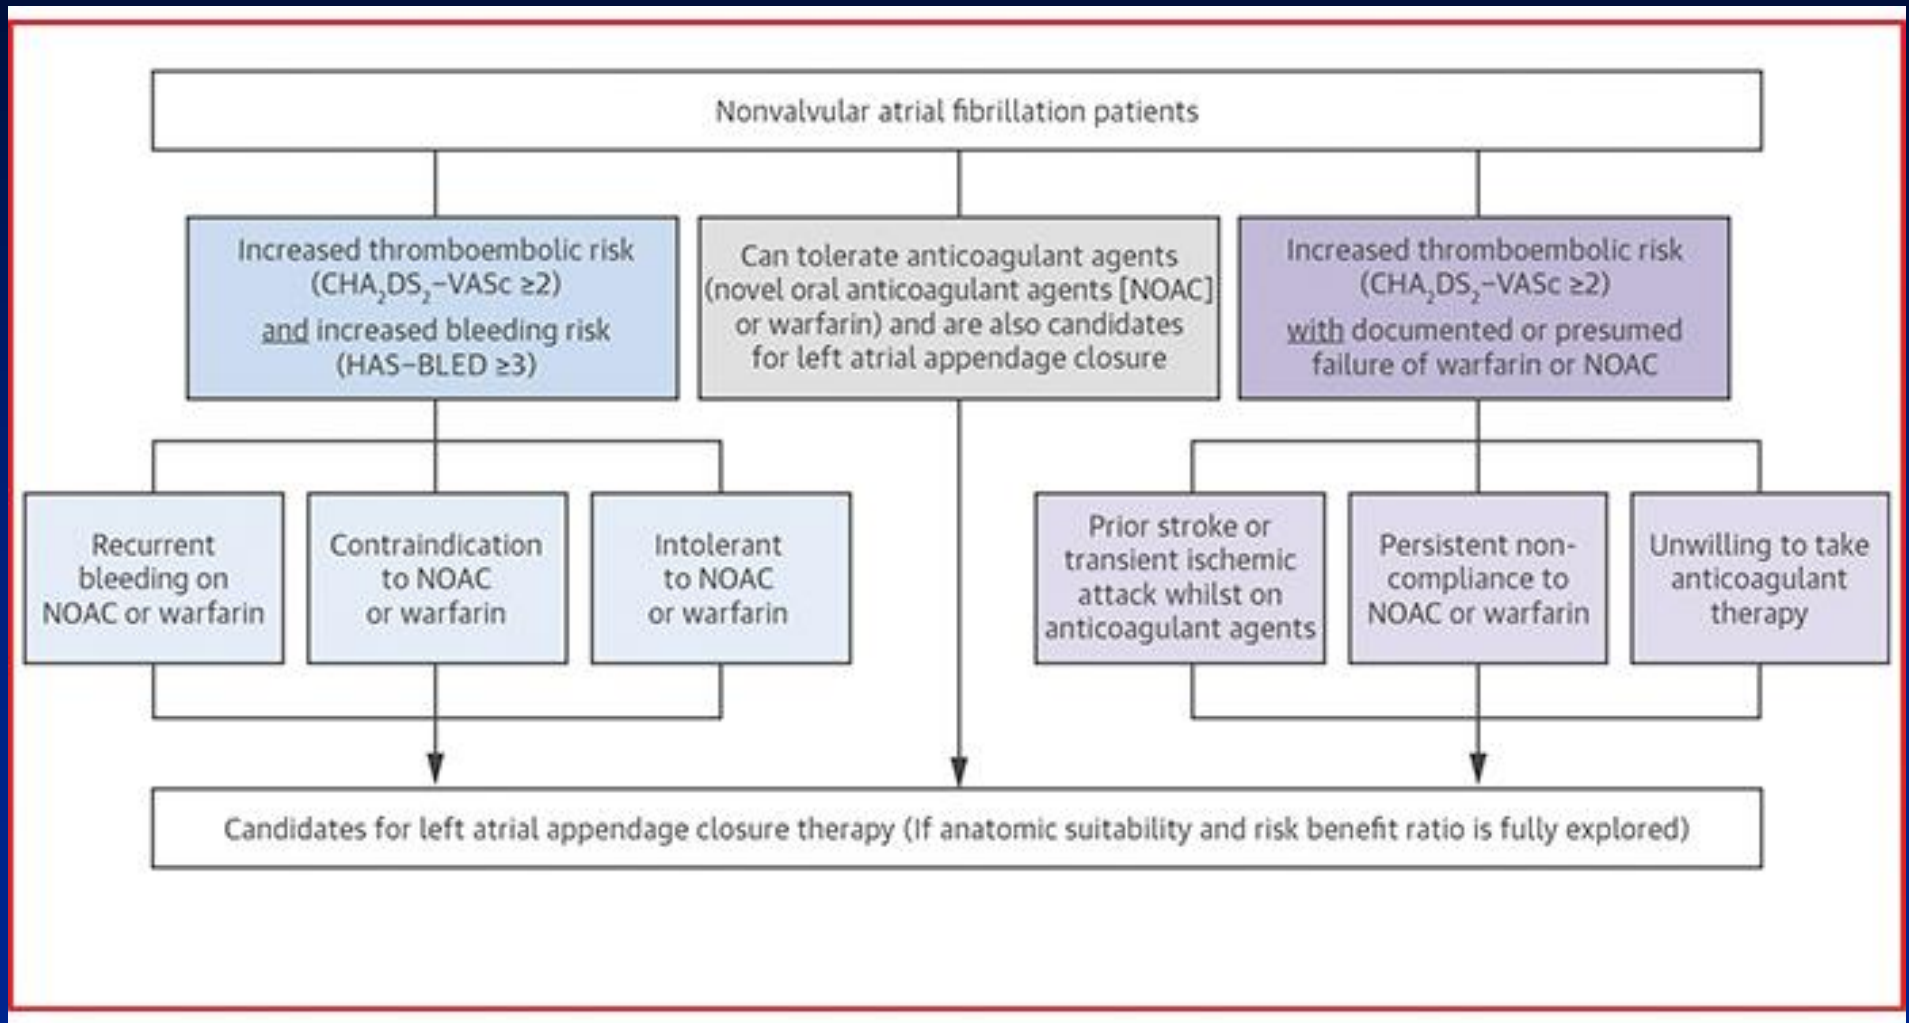
LAAC



Nonvalvular atrial fibrillation patients
Increased thromboembolic risk (CHA_2DS_2–VASc ≥2) and increased bleeding risk (HAS–BLED ≥3)
Can tolerate anticoagulant agents (novel oral anticoagulant agents [NOAC] or warfarin) and are also candidates for left atrial appendage closure
Increased thromboembolic risk (CHA_2DS_2–VASc ≥2) with documented or presumed failure of warfarin or NOAC
Recurrent bleeding on NOAC or warfarin
Contraindication to NOAC or warfarin
Intolerant to NOAC or warfarin
Prior stroke or transient ischemic attack whilst on anticoagulant agents
Persistent non-compliance to NOAC or warfarin
Unwilling to take anticoagulant therapy
Candidates for left atrial appendage closure therapy (If anatomic suitability and risk benefit ratio is fully explored)

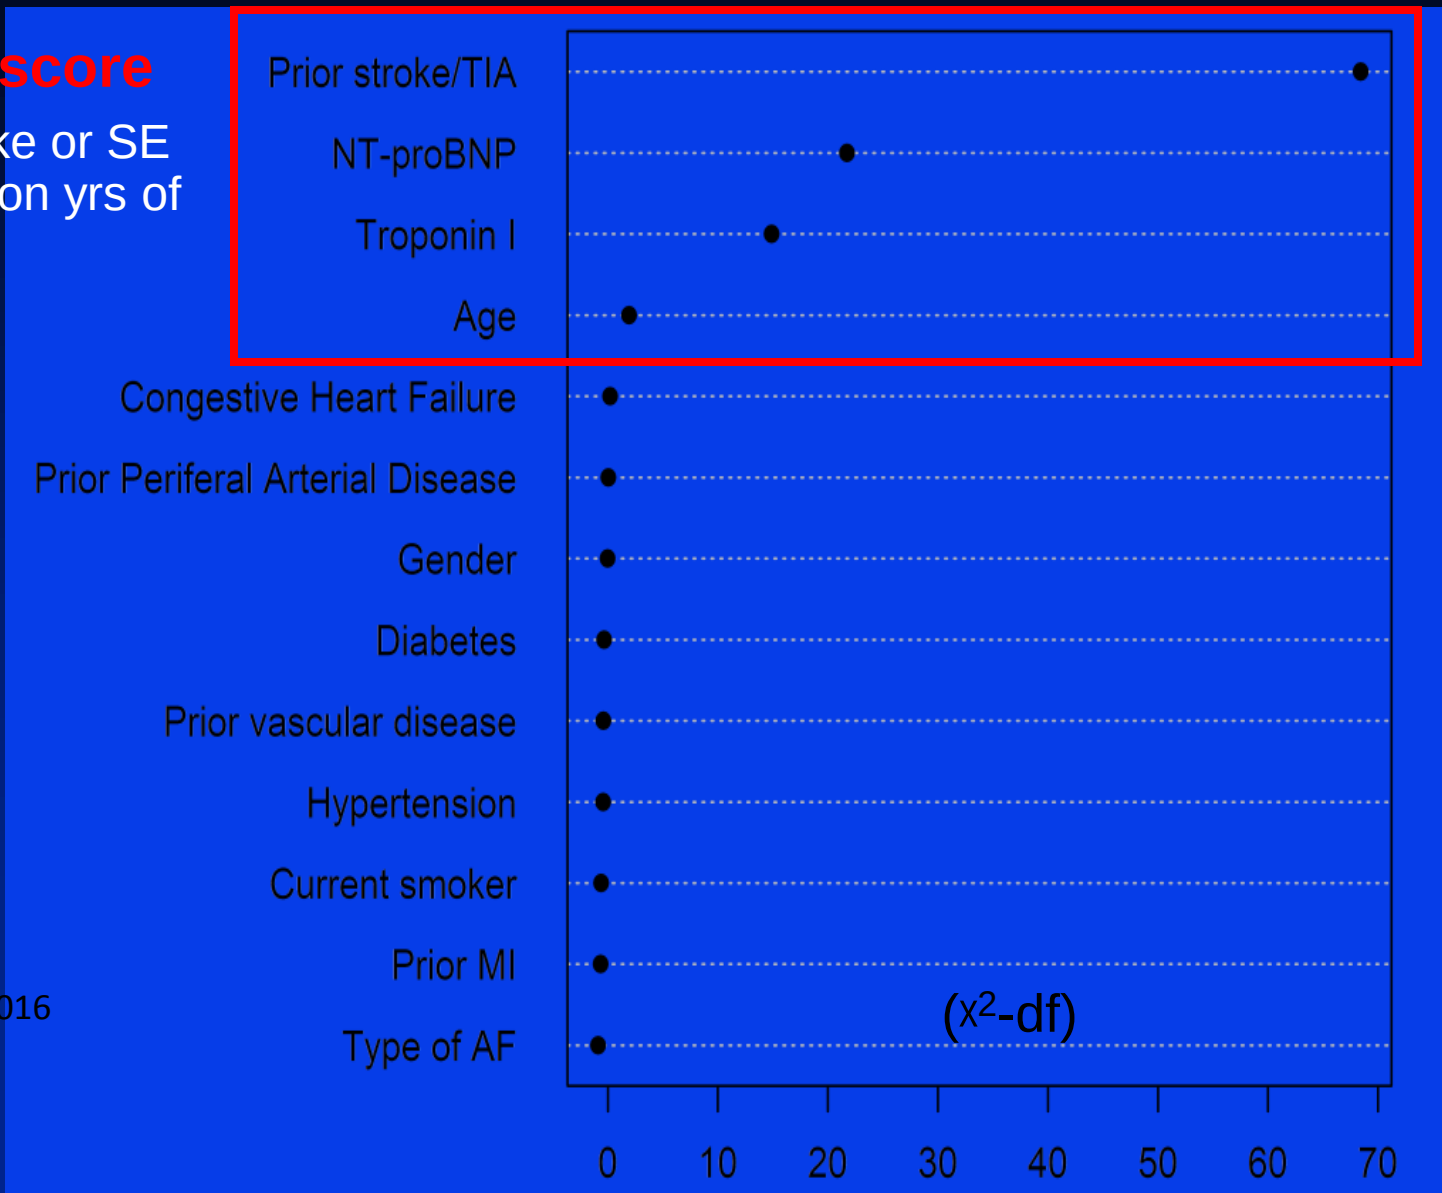
Years

ABC (Age, Biomarker, Clinical factor) risk scores

ABC-stroke score

Based on 391 stroke or SE during 27,929 person yrs of follow-up from the ARISTOTLE trial



Hijazi Z et al. *Eur Heart J* 2016

Risk of Ischemic Stroke or Systemic Embolism after the 3-Month Visit, According to Baseline $CHADS_2$ Score and According to Whether Subclinical Atrial Tachyarrhythmias Were or Were Not Detected between Enrollment and the 3-Month Visit.

Table 3. Risk of Ischemic Stroke or Systemic Embolism after the 3-Month Visit, According to Baseline $CHADS_2$ Score and According to Whether Subclinical Atrial Tachyarrhythmias Were or Were Not Detected between Enrollment and the 3-Month Visit.

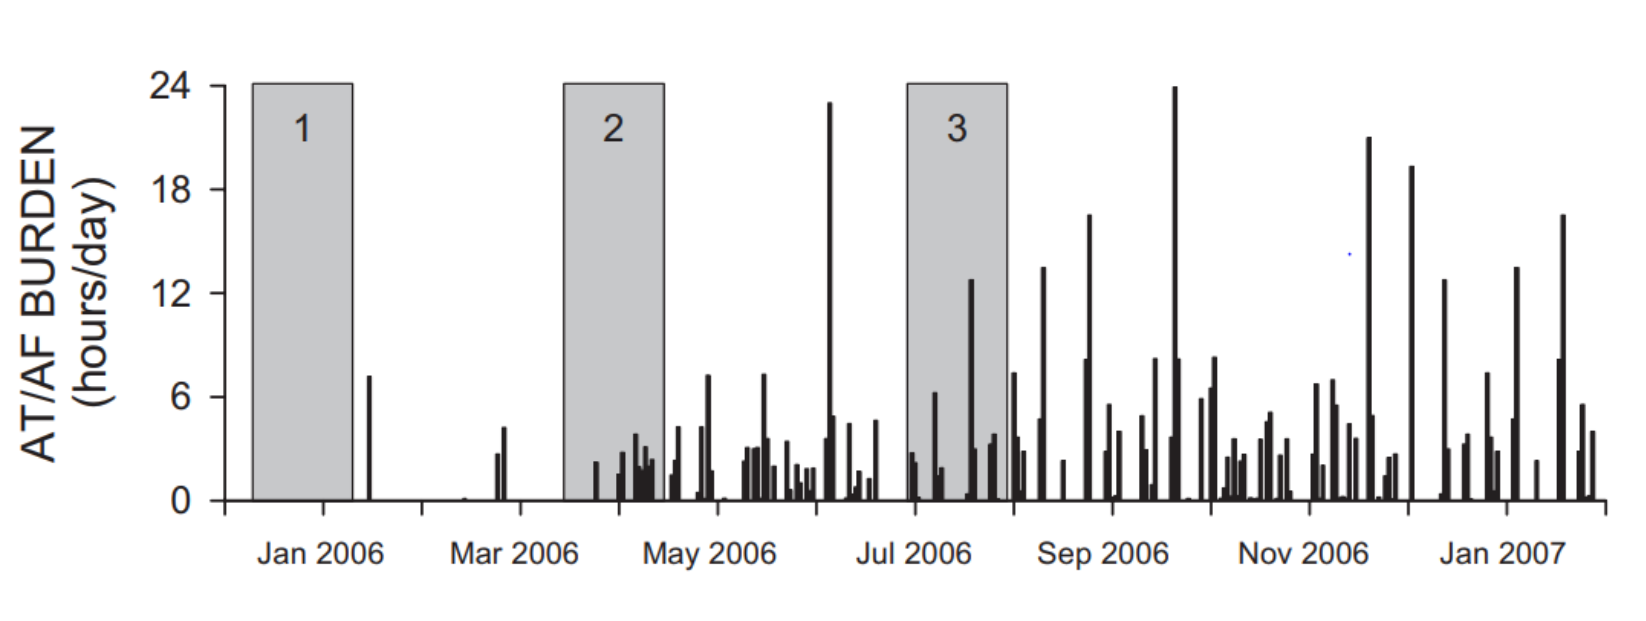
$CHADS_2$ Score	No. of Patients	Subclinical Atrial Tachyarrhythmias between Enrollment and 3 Months						Hazard Ratio for Ischemic Stroke or Systemic Embolism with Subclinical Atrial Tachyarrhythmias (95% CI)*
		Present			Absent			
		no. of patients	*no. of events*	*%/yr*	*no. of patients*	*no. of events*	*%/yr*	
1	600	68	1	0.56	532	4	0.28	2.11 (0.23–18.9)
2	1129	119	4	1.29	1010	18	0.70	1.83 (0.62–5.40)
>2	848	72	6	3.78	776	18	0.97	3.93 (1.55–9.95)

* The P value for trend is 0.35.

Healey JS et al. N Engl J Med 2012;366:120-129

TRENDS STUDY

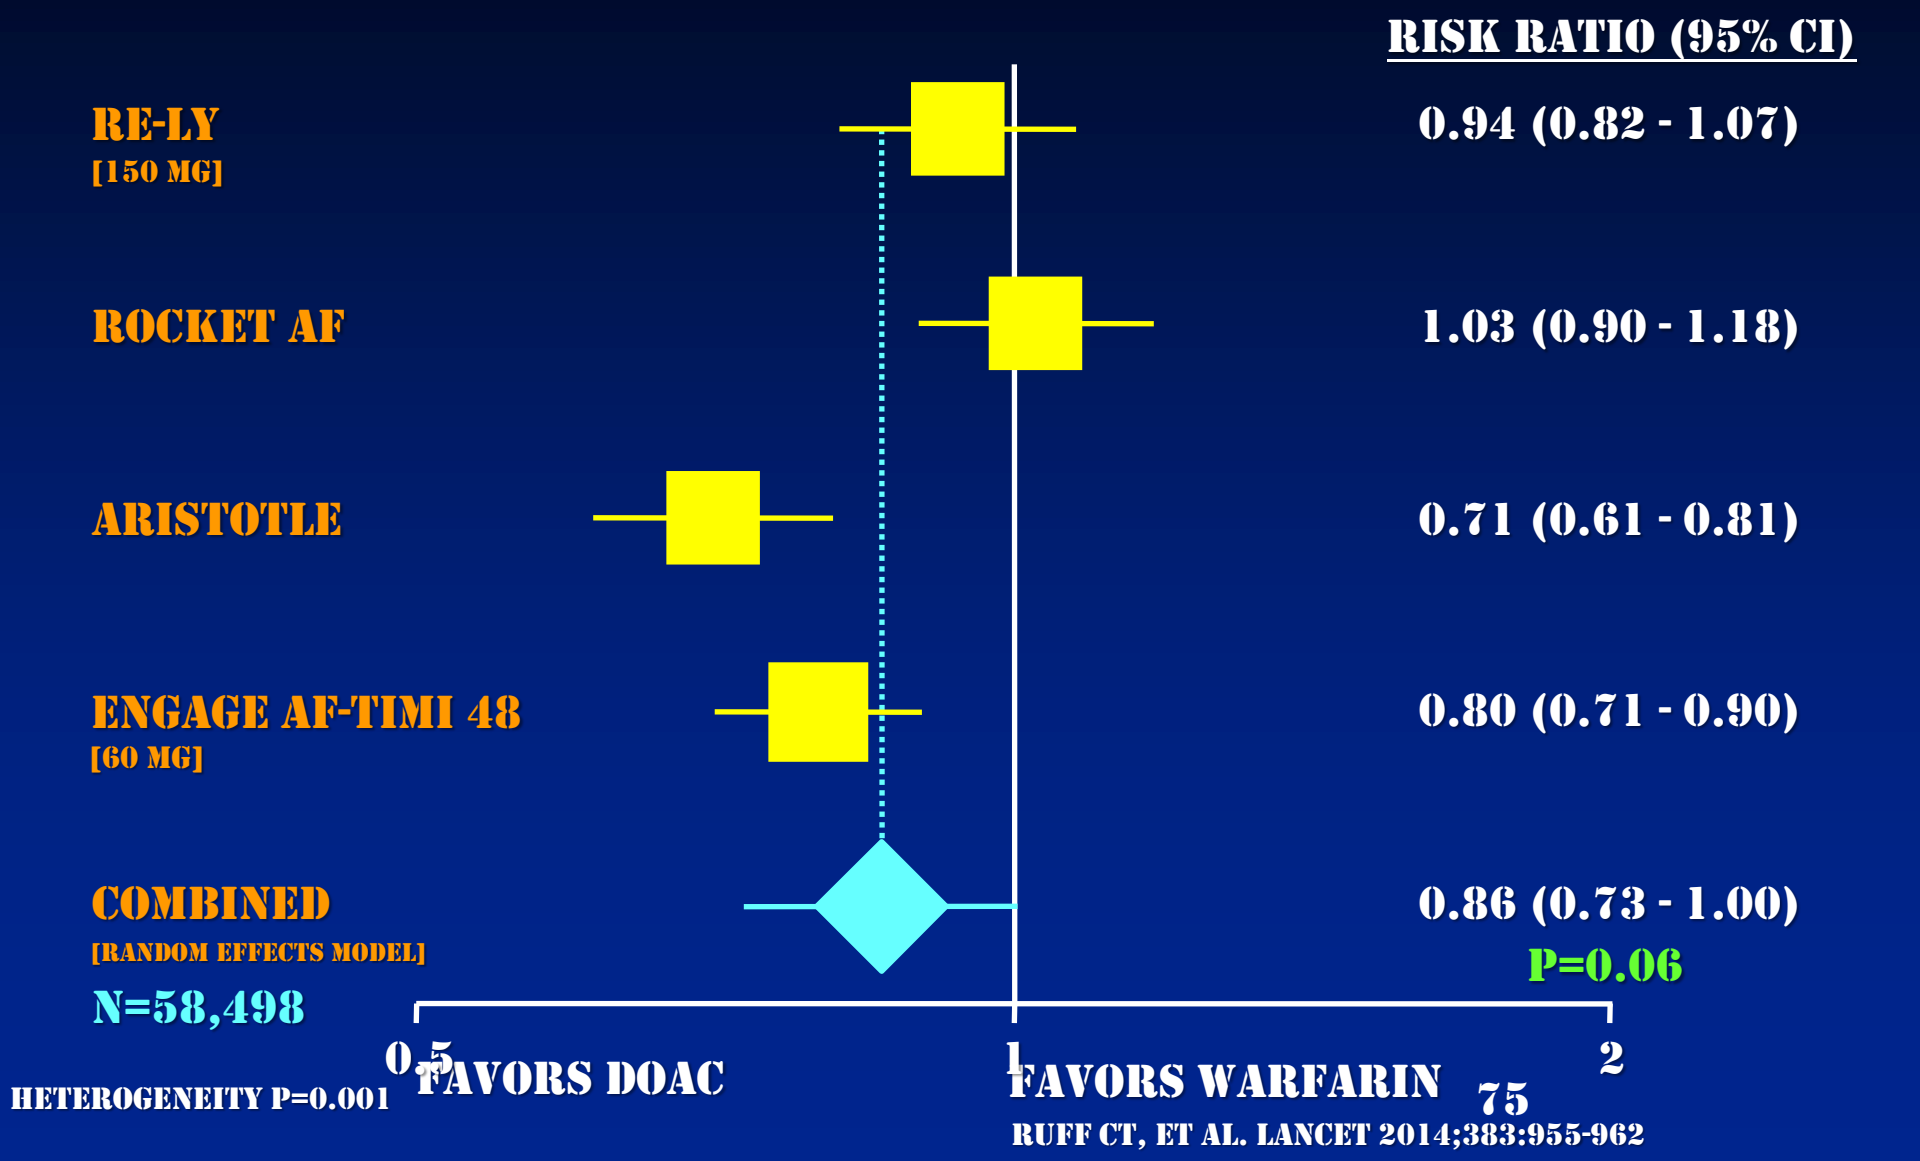
2486 PATIENTS WITH ICD/PACEMAKERS
30 DAYS OF DEVICE DATA
MEAN FOLLOW UP 1.4 YEARS
STUDY A-FIB BURDEN AND RISK OF STROKE



Characteristic/comorbidity	Association with AF
Genetic predisposition (based on multiple common gene variants associated with AF)	HR range 0.4–3.2
Older age 50-59 years 60-69 years 70-79 years 80-89 years	HR: 1.00 (reference) 4.98 (95% CI 3.49–7.10) 7.35 (95% CI 5.28–10.2) 9.33 (95% CI 6.68–13.0)
Hypertension (treated) vs. none	HR 1.32 (95% CI 1.08–1.60)
Heart failure vs. none	HR 1.43 (95% CI 0.85–2.40)
Valvular heart disease vs. none	RR 2.42 (95% CI 1.62–3.60)
Myocardial infarction vs. none	HR 1.46 (95% CI 1.07–1.98)
Thyroid dysfunction Hypothyroidism Subclinical hyperthyroidism Overt hyperthyroidism	(reference: euthyroid) HR 1.23 (95% CI 0.77–1.97) RR 1.31 (95% CI 1.19–1.44) RR 1.42 (95% CI 1.22–1.63)
Obesity (body mass index) None (<25 kg/m²) Overweight (25–30 kg/m²) Obese (≥31 kg/m²)	HR: 1.00 (reference) 1.13 (95% CI 0.87–1.46) 1.37 (95% CI 1.05–1.78)
Diabetes mellitus vs. none	HR 1.25 (95% CI 0.98–1.60)

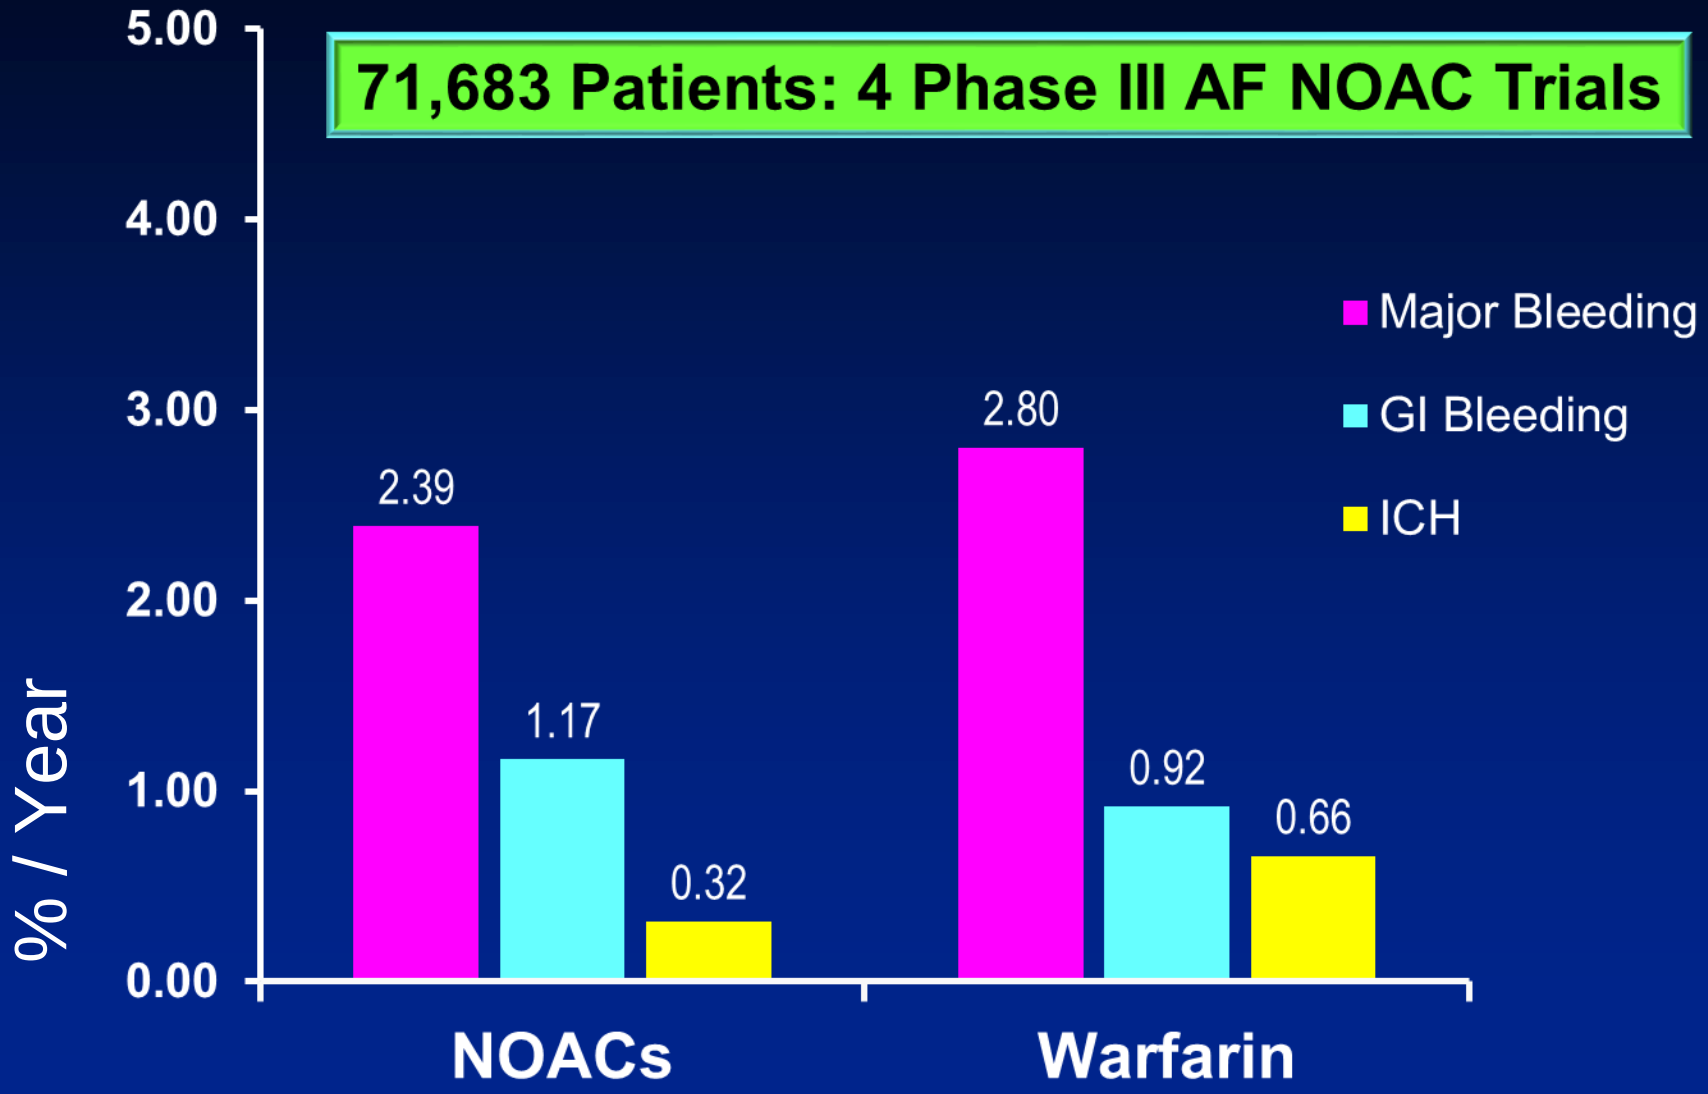
Characteristic/comorbidity	Association with AF
Chronic obstructive pulmonary disease FEV1 ≥80% FEV1 60–80% FEV1 <60%	RR: 1.00 (reference) 1.28 (95% CI 0.79–2.06) 2.53 (95% CI 1.45–4.42)
Obstructive sleep apnoea vs. none	HR 2.18 (95% CI 1.34–3.54)
Chronic kidney disease None Stage 1 or 2 Stage 3 Stage 4 or 5	OR: 1.00 (reference) 2.67 (95% CI 2.04–3.48) 1.68 (95% CI 1.26–2.24) 3.52 (95% CI 1.73–7.15)
Smoking Never Former Current	HR: 1.00 (reference) 1.32 (95% CI 1.10–1.57) 2.05 (95% CI 1.71–2.47)
Alcohol consumption None 1– 6 drinks/week 7–14 drinks/week 15–21 drinks/week >21 drinks/week	RR: 1.00 (reference) 1.01 (95% CI 0.94–1.09) 1.07 (95% CI 0.98–1.17) 1.14 (95% CI 1.01–1.28) 1.39 (95% CI 1.22–1.58)
Habitual vigorous exercise Non-exercisers <1 day/week 1–2 days/week 3–4 days/week 5–7 days/week	RR: 1.00 (reference) 0.90 (95% CI 0.68–1.20) 1.09 (95% CI 0.95–1.26) 1.04 (95% CI 0.91–1.19) 1.20 (95% CI 1.02–1.41)

All DOACS: Major Bleeding



RUFF CT, ET AL. LANCET 2014;383:955-962

HOW FREQUENT IS BLEEDING WITH DOACS?



RUFF CT, ET AL. LANCET. 2014; 383:955-962

PATIENTS WHO SHOULD NOT BE ON NOACs

- Mechanical heart valve[1,2]
- Moderate or severe mitral stenosis[1,2]
- Severe renal* or hepatic impairment[2]
- Extremes of weight (>150 kg or <50 kg)[3]
- Pregnant or lactating women[2]
- Children[2]
- Poor adherence[3]

*Only apixaban may be used in stable patients on hemodialysis; avoid all other NOAC if CrCl < 15 ml/min
